Vandit Singh

vanditsinghkv@gmail.com

Go engineer: backend, distributed systems, and observability. Merged contributor to Kubernetes core, Prometheus, VictoriaMetrics, and Lightning Labs (Bitcoin). Builds production Go services and p2p systems on libp2p.

EDUCATION

ABES ENGINEERING COLLEGE
BTECH IN COMPUTER SCIENCE ENGINEERING
July 2021 - July 2025

SKILLS

LANGUAGES
Golang • Python • JavaScript (Node, React) • Java • Shell • SQL

BACKEND & APIS
REST • gRPC • Microservices • OAuth2 / OIDC • JWT • OpenAPI

DISTRIBUTED SYSTEMS
go-libp2p • Kademlia DHT • Content Addressing • libp2p streams • etcd

CLOUD & DEVOPS
AWS • GCP • Docker • Kubernetes • Terraform • Helm • GitHub Actions • GitLab CI • Linux

OBSERVABILITY
Prometheus • Grafana • OpenTelemetry • Alertmanager • Loki • ELK • Filebeat

DATA & SECURITY
PostgreSQL • Redis • MongoDB • MySQL • Elasticsearch • TLS/SSL • Container Hardening • CVE Workflow

TESTING & TOOLING
Prow / test-infra • Unit & Integration Testing • Nginx • Bash • Git

RECOGNITION

• I mentored college students for Google Summer of Code, and several were later selected.
• I was President of the GeeksforGeeks ABESEC Chapter, where I led 40+ core members and grew the community to 2500+ students.
• I am a founding member of the Elixir Tech Community.
• I earned the GSoC '23 Completion Certificate with Jenkins.

EXPERIENCE

FLUIDCLOUD | MEMBER OF TECHNICAL STAFF
Nov 2025 – May 2026

• I built Terraform-aware scanning in a **Go** cloud scanner that reads **10,000+ live AWS resources in under 5 seconds** across **10+** services (Glue, Kinesis, SageMaker).
• I instrumented **observability** across **5+ microservices** with **OpenTelemetry** traces and metrics into Prometheus and Grafana, and I added structured trace-ID logging that made cross-service debugging traceable.
• I owned service-to-service authentication end to end with **Keycloak** (OAuth2 client-credentials and OIDC), securing all internal API traffic.

AQUANODE | FOUNDER (OWN PRODUCT)
June 2025 – Oct 2025

• I built and owned the **Go control plane** for a **GPU cloud**: Mjolnir orchestrates deployments across **3** providers (DataCrunch, Hyperstack, Nebius) through a **reconciliation loop** that converges on live state despite unreliable provider APIs.
• I built Ogre, a distributed daemon that runs deployment backups and health checks across the fleet, exposed through the control-plane API.

RAPIDFORT INC. | SDE, COMMUNITY IMAGES THEN SECURITY SCANNER
June 2024 – Nov 2025

• On Community Images, I authored **12+** hardened OSS images shipped in the **U.S. DoD IronBank**, and runtime profiling cut CVEs by **~80%** and image size by **~60%**.
• On the Security Scanner, I owned a **Config Manager** (Python, RBAC) **adopted by 4 teams** and built a "sister-CVE" detector (LLM + Exploit-DB) at an **81% hit rate**.
• I set up the **ELK + Filebeat** logging stack single-handed, which sharply cut debugging time for the OS CVE scrapers.

OPEN SOURCE

MERGED CONTRIBUTOR | BITCOIN, OBSERVABILITY, KUBERNETES
2022 – Present

• In **Bitcoin / Lightning** (Go), I merged PRs into Lightning Labs' `lightning-terminal` [PR] and `taproot-assets` [PR], with open PRs in `neutrino` and `lnd`.
• In **observability**, I added a query-limit parameter to Prometheus `/query` and `/query_range` [PR], merged **16** PRs across the VictoriaMetrics org [PRs], and added a metric to `memcached_exporter`.
• In **Kubernetes**, I merged a regression test into core `kubernetes/kubernetes` [PR] and contributed **5+** test-infra PRs plus Kueue CI tooling.
• Through **GSoC with Jenkins** (contributor 2023, then mentor 2024), I rebuilt the documentation site on a versioned GatsbyJS + Antora architecture and shipped Helm charts and CI/CD for jenkins-infra.

PROJECTS

PHILE STORAGE & DOCKERIUM | PHILE-STORAGE • DOCKERIUM
Go • go-libp2p • Kademlia DHT • Linux Namespaces

• I built **phile-storage**, content-addressed P2P storage (CIDv1 + SHA-256) with **trustless retrieval**, over a **go-libp2p** layer I wrote myself (persisted PeerID, **Kademlia DHT** routing, custom stream protocol). **Dockerium** is a rootless container runtime I built from scratch on Linux namespaces.
